

The Development of Energy Recovery Linacs

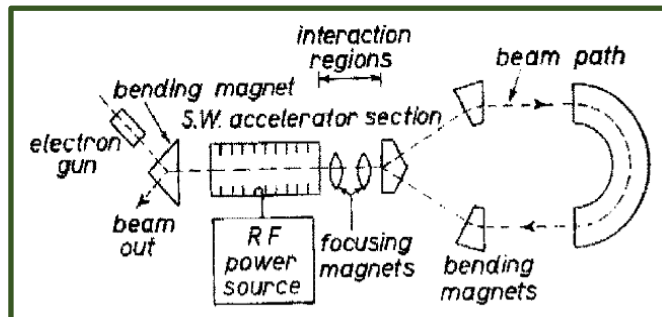

A Contribution to the European Strategy for Particle Physics

The ERL Study Group

Abstract (DRAFT)

Energy recovery linacs (ERL's) have been emphasised by the recent (2020) update of the European Strategy for Particle Physics as one of the most promising technology for the accelerator base of future high energy physics. They are indeed beginning to assert their potential as game changers in the field of accelerators and their applications. Their unique combination of bright, linac-like beam quality with high average current and extremely flexible time structure, unprecedented operating efficiency and compact footprint opens the door to previously unattainable performance regimes. This paper summarises the previous achievements on ERLs and the status of the field and its basic technology items. The main possible future contributions and applications of ERLs to

1. Introduction	
1.1. The Magic Principle of Energy Recovery, its Promises and Past	
1.1.1. History	
1.1.2. The Technology	
1.2. Particle Physics and the Importance of ERLs	
1.3. Outline	
2. ERL - Facilities and Current Status	
2.1. Completed Facilities	
2.1.1. ALICE at Daresbury	
2.1.2. JLab FEL	
2.1.3. CEBAF Single-pass Energy Recovery Experiment (CEBAF-ER)	
2.2. Ongoing Activities	
2.2.1. CBETA at Cornell	
2.2.2. S-DALINAC at Darmstadt	
2.2.3. bERLinPro	
2.2.4. cERL at KEK	
2.2.5. Recuperator at Novosibirsk	
3. ERL - New Facilities in the Twenties	
3.1. MESA	
3.2. PERLE at Orsay	
3.3. CEBAF 5-pass Energy Recovery Experiment	
3.4. Electron Cooler at BNL	
4. Key Challenges - a Concerted Effort	
4.1. Low Emittance, High Current Sources	
4.1.1. Photo cathodes	
4.1.2. Buncher and Booster	
4.1.3. Merger	
4.2. Challenges of SRF Cavities and Cryomodules	
4.3. Multi-turn ERL Operation and the Art of Arcs	
4.3.1. Multi-turn Recirculating Linacs and their Extension to Multi-turn ERLs	
4.3.2. Topology and Recovery Transport Choices	
4.3.3. Arc Lattice Choices	
4.3.4. The Spreader-Arc-Recombiner as a Single System	
4.3.5. Multi-turn Operational Experience	
4.4. ERL Operation Challenges	
4.4.1. Introduction	
4.4.2. Challenges	
4.4.3. Space Charge	
4.4.4. Beam Breakup Instability

[from report to LDG]

A selection of **past**, **present** and **proposed** ERL facilities: Power = $E_e I_e$

ERL Features:

Very high luminosity through high electron current and small preserved injector emittance. Economic use of power $P_o/(1 - \eta)$ through recovery in multiple linac passing (recirculator or head-on). Non-radiative beam dump at injection energy. → orders of magnitude improved performance at same or reduced power, **a new era for accelerator, HEP, NP and applications**

“The ERL concept is well proven and the technology is well developed. Many demonstrator facilities exist worldwide with increasing sophistication. It needs a facility comprising all essential features simultaneously: high-current, multi-pass, optimised cavities and cryo-modules and a physics quality beam eventually for experiments”. (Bob Rimmer at ERL Symposium, June 4, 2021)

Energy Frontier Collider Applications of Energy Recovery Linacs

$\sqrt{s_{ep}} = 1-4 \text{ TeV}$
 $L(\text{HERA}) \times 1000$
 (ERL and LHC)
 1206.2913, JPhysG
 2007.14491, JPhysG
 $f=802\text{Mz}$,
 3+3 passes: 20mA x 6
 20 MV/m, $Q_0 > 10^{10}$

CERC FCC-ee as ERL

arXiv:1909.04437, PLB (2020)
 Litvinenko, Roser, Chamizo Llatas
 $L(tt) \sim 10^{35} = O(100)$ std $L(tt)$, $E(HH)$
 $f=1.3 \text{ GHz}$ 4+4 passes, 91mA
 20 MV/m, $Q_0 = 3 \cdot 10^{10}$

ERLC ILC as ERL

V. Telnov at LCWS → arXiv:2105.11015
 $L(\text{ERLC}) \sim 10^{36} = O(100)$ std $L(\text{ILC})$
 This yields $O(10^7)$ HZ events in 3 years.
 1+1 passes, $l=160\text{m}$
 $f=750 \text{ MHz}$, 20 MV/m, $Q_0 > 10^{10}$

Figure 2: Sketch of possible future colliders based on ERLs: left top: LHeC and FCC-eh; right top: CERC; bottom: ERLC. For more information see the arXiv references displayed.

Evaluation of ERL concepts for FCC-ee [CERC] and the ILC [ERLC]

Vladimir Litvinenko+ <https://doi.org/10.1016/j.physletb.2020.135394> ;
Valery Telnov, <https://arxiv.org/abs/2105.11015>

The Sub-Panel should evaluate the technical and financial implications of the two novel concepts compared to the FCC-ee and ILC projects:

What are the technical advances, specifically in luminosity?
What are the technical solutions + obstacles requiring R&D?
How much time would that additionally require?
What is the rough cost implication (to about 10%)

Sub-Panel members

Chris Adolphsen (SLAC)	Reinhard Brinkmann (DESY)
Oliver Brüning (CERN)	Andrew Hutton (JLab) – Chair
Sergei Nagaitsev (Fermilab)	Max Klein (Liverpool)
Peter Williams (STFC)	Akira Yamamoto (KEK)
Kaoru Yokoya (KEK)	Frank Zimmermann (CERN)

The e^+e^- ERL Sub-Panel

Dates for the sub-Panel

Kick-off meeting held June 9, 2021

Completion by September 3, 2021

Deliverable:

A short report (~20 pages) detailing the conclusions of the evaluation, which should be agreed and supported by the entire sub-Panel and published as Appendix B to the full Panel report.

Methodology: Sessions with proponents to begin with. Sessions open to other ERL panel members

Procedure agreed with the proponents

ERL Symposium

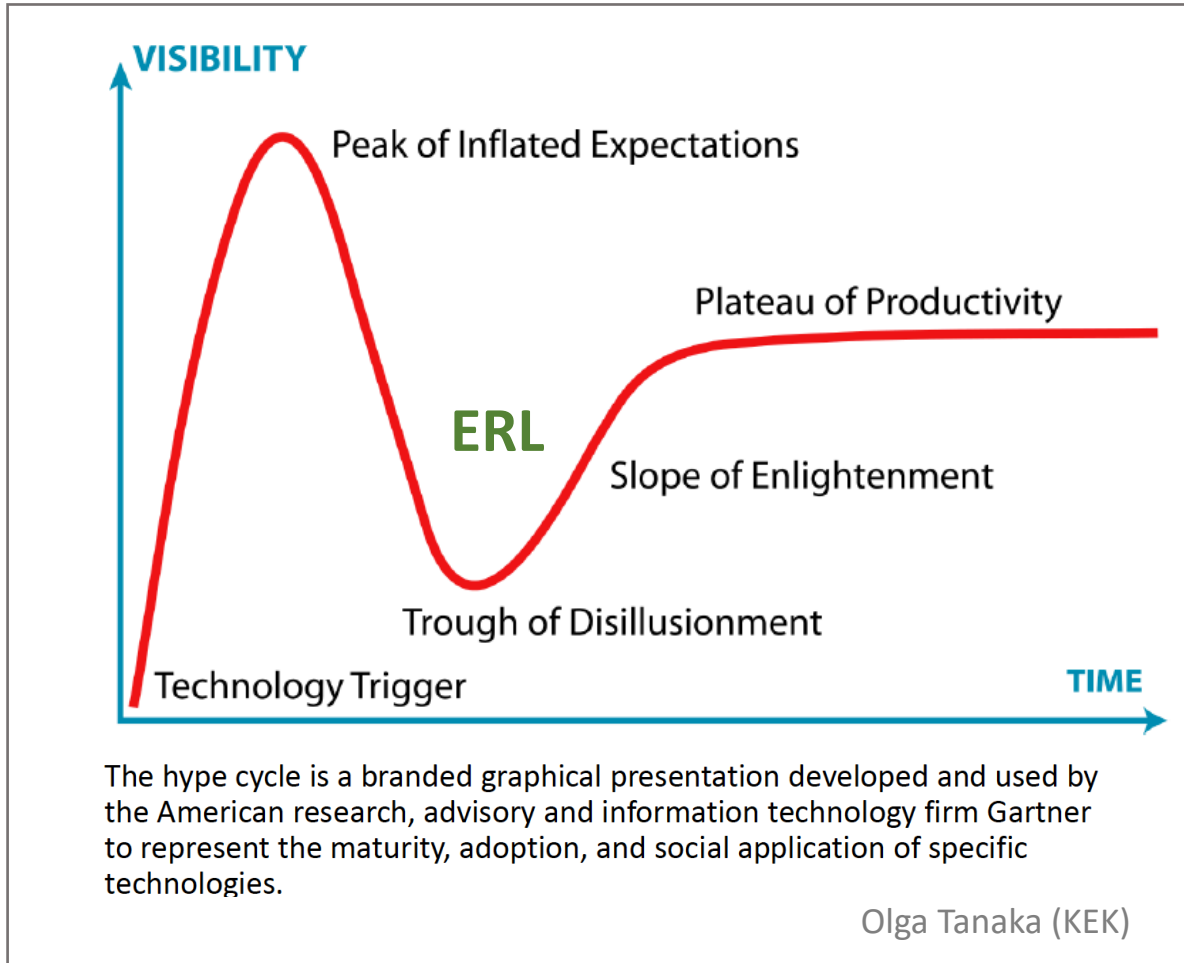

Friday 4.6. 1-5pm CEST

<https://indico.cern.ch/event/1040671/>

The symposium was an important event for information, consultation and formation of a more coherent R&D ERL effort.

Current Summary: ERLs - a Progressing, Revolutionary Technology

Based on decades of SRF, FEL, ERL, Facility.. developments*) :

The debate now is about the conditions for ERLs to reach their productivity plateau and the demands implied on R&D, financial, intellectual and technical support.

An initial observation (not only) by the panel: ERLs are more than an appealing technology:

They (cor)respond to **A NEW ERA** in particle and several other fields of physics, industry, accelerators .. in a world that cannot proceed without renewed care for our planet.

ERLs, as came out at the Symposium, are technologies with far reaching impacts on science + society.

Next: Working towards the ERL Roadmap
