#### Vector calculus

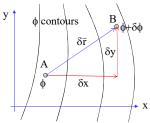

- In this lecture we will:
  - Sketch out how we can derive a potential from a field using line integrals.
  - ♦ Do an example to check it works!
  - Look at a physical example: deriving the electric potential from the electric field.
  - Mention a caveat: there are some fields that cannot be derived from potentials.

- Some comprehension questions for this lecture.
  - What is the potential associated with the field:

$$\vec{E}(x,y,z) = \begin{pmatrix} yz + 2xy \\ x^2 + xz + z^2 \\ xy + 2yz \end{pmatrix}?$$

## Deriving a potential from a field

- We have seen that we can get a field from a potential:  $\vec{F}(x, y, z) = \nabla \phi(x, y, z)$ .
- Suppose we have a field  $\vec{F}(x, y)$ , can we derive from this the associated potential  $\phi(x, y)$ ?
- Illustrate idea in 2D (more formal proof in text books!).

- Consider stepping from A to B in the scalar field  $\phi(x, y)$ .
- Change in  $\phi$  is  $\delta \phi$ , given by slope in direction of movement and step length.
- For step δx in x direction:

$$\delta \varphi_x \approx \frac{\partial \varphi(x,y)}{\partial x} \delta x = F_x \delta x.$$

For subsequent step δy in y direction

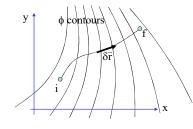

$$\begin{split} \delta \phi_{y} &\approx \frac{\partial \phi(x + \delta x, y)}{\partial y} \delta y \\ &\approx \frac{\partial \phi(x, y)}{\partial y} \delta y \approx F_{y} \delta y. \end{split}$$

If step in x then y,  $\delta \phi \approx \delta \phi_x + \delta \phi_y$ .

1

## Deriving a potential from a field

- Rewriting this:  $\delta \phi \approx F_{y} \delta x + F_{y} \delta y$ .
- Now take n steps from initial position i to final position f:

The total change in φ is then

$$\sum_{n} \delta \phi_{n} \approx \sum_{n} F_{x}(x_{n}, y_{n}) \delta x_{n} + F_{y}(x_{n}, y_{n}) \delta y_{n}$$

■ Taking the limit of infinitely many infinitely small steps:

$$\int d\phi = \int_{C} F_{x}(x, y) dx + F_{y}(x, y) dy$$
$$\phi = \phi(x_{i}, y_{i}) + \int_{C} (F_{x}, F_{y}) \cdot (dx, dy)$$
$$= \phi(x_{i}, y_{i}) + \int_{C} \vec{F} \cdot d\vec{r}$$

- The subscript C tells us to move along curve from i to f.
- If start at (0, 0) and move to (x, y) we have "climbed"  $\phi(x, y) - \phi(0, 0)$ .

## Deriving a potential from a field

Example:

2

4

- Field  $\vec{E}(x,y) = (2x + y + x)$ .
- Find the associated potential,
- Integrate along  $\vec{r}(t) = (x(t) \ y(t))$

$$= (xt yt), t = 0...1.$$
  $= \phi_0 + x^2 + \frac{xy}{2} + \frac{xy}{2}$ 

Then:  

$$\phi(x,y) = \phi_0 + \int_0^1 \vec{E}(x(t),y(t)) \cdot \frac{d\vec{r}(t)}{dt} dt$$

$$= \phi_0 + x^2 + xy.$$
• Check:

$$= \phi_0 + \int_0^1 E_x(x(t), y(t)) \frac{dx(t)}{dt} dt$$
$$+ \int_0^1 E_x(x(t), y(t)) \frac{dy(t)}{dt} dt$$

Using  $\frac{dx(t)}{dt} = \frac{dxt}{dt} = x$  and  $\frac{dy(t)}{dt} = y$ ,

$$\phi = \phi_0 + \int_0^1 [2(xt) + (yt)] \times x \, dt + \int_0^1 (xt) \times y \, dt$$

$$= \phi_0 + \frac{t^2}{2} \times (2x^2 + xy) + \frac{t^2}{2} \times xy \Big|_0^1$$

$$= \phi_0 + x^2 + \frac{xy}{2} + \frac{xy}{2}$$

$$= \phi_0 + x^2 + xy.$$

$$= \phi_0 + \int_0^1 E_x (x(t), y(t)) \frac{dx(t)}{dt} dt \\ + \int_0^1 E_y (x(t), y(t)) \frac{dy(t)}{dt} dt \qquad \nabla \phi = \begin{pmatrix} \frac{\partial}{\partial x} x^2 + xy + \phi_0 \\ \frac{\partial}{\partial y} x^2 + xy + \phi_0 \end{pmatrix} = \begin{pmatrix} 2x + y \\ x \end{pmatrix} = \bar{E}$$

3

### Electric potential from electric field

 Electric field due to point charge given by:

$$\vec{E} = \frac{q}{4\pi\epsilon_0} \begin{bmatrix} \frac{x}{\left(x^2 + y^2 + z^2\right)^{\frac{3}{2}}} \\ \frac{y}{\left(x^2 + y^2 + z^2\right)^{\frac{3}{2}}} \\ \frac{z}{\left(x^2 + y^2 + z^2\right)^{\frac{3}{2}}} \end{bmatrix}$$

Using line integral method:

$$\begin{split} & \phi = \phi_0 + \int_0^z \vec{E} \cdot d\vec{r} \\ & = \phi_0 + \int_0^z E_x \frac{dx}{dt} dt + \int_0^t E_y \frac{dy}{dt} dt + \int_0^t E_z \frac{dz}{dt} dt \\ & \text{with } \vec{r}(t) = \begin{pmatrix} xt \\ yt \\ zt \end{pmatrix} \text{ and taking the path } \end{split}$$

to be from t = 0 to t = 1 as before.

• Write 
$$\frac{q}{4\pi\epsilon_0} = K$$

# Electric potential from electric field

■ Look at E<sub>v</sub> integral:

$$\int_{0}^{1} E_{x} \frac{dx}{dt} dt = K \int_{0}^{1} \frac{xt}{\left((xt)^{2} + (yt)^{2} + (zt)^{2}\right)^{\frac{1}{2}}} x dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \int_{0}^{1} \frac{t}{\left(t^{2}\right)^{\frac{1}{2}}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \int_{0}^{1} \frac{1}{t^{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \int_{0}^{1} \frac{1}{t^{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \left(\frac{1}{t^{2}}\right)^{\frac{1}{2}} dt$$

$$= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} dt$$

$$= K \frac{x^{2}}{\left(x^{2$$

■ There is a problem, can't evaluate one limit of integral: E infinite at origin!

- One solution is to change the path.
- Move from point at infinity to position (x, y, z) then have:

$$\begin{split} \exists_{x} \frac{dx}{dt} dt &= K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}} \frac{-1}{t} \bigg|_{\infty}^{1} \\ &= -K \frac{x^{2}}{\left(x^{2} + y^{2} + z^{2}\right)^{\frac{1}{2}}}. \end{split}$$

- Repeat for  $E_y$  and  $E_z$  and add results:  $\phi = \phi_{\infty} - K \frac{\left(x^2 + y^2 + z^2\right)}{\left(x^2 + y^2 + z^2\right)^{\frac{3}{2}}} = -\frac{q}{4\pi\epsilon_0} \frac{1}{r}.$ Note minus sign, not present when
- "physics convention" used, we have decided  $\vec{E} = -\nabla \phi$  not  $\vec{E} = \nabla \phi$ .

5

#### Caveat: fields that are not derivable from potentials

- Recall from lecture 6:  $\nabla \times (\nabla \phi) = 0$ .
- Hence, a vector field derived from a potential, e.g.  $\vec{E} = \nabla \phi$ , must always satisfy  $\nabla \times \vec{E} = 0$ .
- Conversely, a field for which the curl is not zero cannot be derived from a potential.
- $\blacksquare \text{ E.g. } \vec{F} = |xz 3yz|$ xy + 2z
- Using our prescription...

$$\phi = \phi_0 + \int_0^1 yt \, zt \, x \, dt + \int_0^1 (xt \, zt - 3yt \, zt) y \, dt + \int_0^1 (xt \, yt + 2zt) z \, dt.$$

So:  $\phi = \phi_0 + xyz \int t^2 dt + (xyz - 3y^2z) \int t^2 dt$  $+xyz\int_{0}^{1}t^{2}dt+2z^{2}\int_{0}^{1}t\,dt$ 

$$= \phi_0 + xyz \frac{t^3}{3} + (xyz - 3y^2z) \frac{t^3}{3} \bigg|_{0}^{1}$$

$$= \phi_0 + xyz\frac{t^3}{3} + (xyz - 3y^2z)\frac{t^3}{3}$$
$$+ xyz\frac{t^3}{3} + 2z^2\frac{t^2}{2}\Big|^1.$$

$$\Rightarrow \phi = \phi_0 + xyz - y^2z + z^2$$
.

Now calculate field:

$$\nabla(xyz - y^2z + z^2) = \begin{pmatrix} yz \\ xz - 2yz \\ xy - y^2 + 2z \end{pmatrix} \neq \vec{F}.$$

6
