## Problems class 8

Work out how far you can make four bricks of length $L$ extend over the bank of a stream if arranged as shown below. Can you think of an arrangement that allows a larger overhang over the stream using the same bricks?

Problems class 8

A ladder of length 24 m and mass 20 kg is leaning against a vertical wall at an angle of $30^{\circ}$. If a window cleaner of mass 80 kg is standing half way up the ladder, calculate the magnitude of the horizontal force the wall exerts on the ladder. The coefficient of static friction between the wall and the ladder is negligible, and that between the ladder and the ground is 0.1 (the ground is icy!), calculate the vertical force exerted on the ladder by the ground on which it is standing. Determine whether the base of the ladder will slip away from the wall.
